

## M378K Introduction to Mathematical Statistics

### Problem Set #4

#### Expectation and variance: the discrete case.

---

**Problem 4.1.** Source: Sample P exam, Problem #481.

*The number of days required for a damage control team to locate and repair a leak in the hull of a ship is modeled by a discrete random variable  $N$ .  $N$  is uniformly distributed on  $\{1, 2, 3, 4, 5\}$ .*

*The cost of locating and repairing a leak is  $N^2 + N + 1$ .*

*Calculate the expected cost of locating and repairing a leak in the hull of the ship.*

**Solution:** We need to calculate

$$\mathbb{E}[N^2 + N + 1] = \mathbb{E}[N^2] + \mathbb{E}[N] + 1.$$

By definition

$$\begin{aligned}\mathbb{E}[N] &= 1 \cdot \frac{1}{5} + \cdots + 5 \cdot \frac{1}{5} = \frac{1}{5} \cdot \frac{5 \cdot 6}{2} = 3, \\ \mathbb{E}[N^2] &= 1^2 \cdot \frac{1}{5} + \cdots + 5^2 \cdot \frac{1}{5} = \frac{1}{5} \cdot \frac{5 \cdot 6 \cdot 11}{6} = 11.\end{aligned}$$

Our final answer is  $3 + 11 + 1 = 15$ .

**Problem 4.2.** Source: Sample P exam, Problem #458.

*An investor wants to purchase a total of ten units of two assets,  $A$  and  $B$ , with annual payoffs **per unit** purchased of  $X$  and  $Y$ , respectively. Each asset has the same purchase price per unit. The payoffs are independent random variables with equal expected values and with  $\text{Var}(X) = 30$  and  $\text{Var}(Y) = 20$ .*

*Calculate the number of units of asset  $A$  the investor should purchase to minimize the variance of the total payoff.*

**Solution:** Let the number of units of asset  $A$  be denoted by  $n$ . Then, the total payoff will be equal to

$$nX + (10 - n)Y.$$

The variance of the total payoff will be

$$\text{Var}[nX + (10 - n)Y].$$

Due to independence of  $X$  and  $Y$ , using the properties of variance, we get that the above equals

$$n^2 \text{Var}[X] + (10 - n)^2 \text{Var}[Y] = 30n^2 + 20(10 - n)^2 = 50n^2 - 400n + 2000 = 50(n^2 - 8n + 40).$$

We need to minimize the above with respect to  $n$ . This is easily done by noticing that  $n^2 - 8n + 40$  is a parabola facing up. So, all we need to do is to figure out the position of its "bottom". In the notation you might recall from quadratic equations, it is

$$n^* = -\frac{B}{2A} = -\frac{-8}{2 \cdot 1} = 4.$$

*Note: Yes, you could have also differentiated to find the minimum.*
