

UNIVERSITY OF TEXAS AT AUSTIN

Quiz #17CAPM consequences.

Please, provide your complete solutions to the following problems:

Problem 17.1. (5 points) For a certain stock, you are given that its expected return equals 0.12 and that its β equals 1.2. For another stock, you are given that its expected return equals 0.07 and that its β equals 0.4. Both stocks lie on the **Security Market Line (SML)**. What is the risk-free interest rate r_f ?

Please, provide your final answer only to the following questions:

Problem 17.2. (2 points) We can use linear regression to estimate the *beta* of a stock. *True or false?*

Problem 17.3. (2 points) Assume the assumptions of CAPM. Then, the **capital market line (CML)** is the tangent line of the feasible set going through the market portfolio. *True or false?*

Problem 17.4. (2 points) The stocks **alpha** (α) measures the distance the stock's average return is away from the **security market line (SML)**. *True or false?*

Problem 17.5. (2 points) The **beta** (β) of a portfolio is a weighted average of the betas of the individual components in the portfolio. *True or false?*

Problem 17.6. (2 points) A portfolio is efficient if and only if the expected return of every available security equals the required return of that security with respect to that portfolio. *True or false?*
