## M378K Introduction to Mathematical Statistics

## Problem Set #15

Bias. MSE.

Problem 15.1. Source: "Mathematical Statistics with Applications" by Wackerly, Mendenhall, Scheaffer.

Let  $Y_1, Y_2, Y_3$  be a random sample from  $E(\tau)$ . Consider the following five estimators of  $\tau$ :

$$\hat{\theta}_1 = Y_1, \quad \hat{\theta}_2 = \frac{Y_1 + Y_2}{2}, \quad \hat{\theta}_3 = \frac{Y_1 + 2Y_2}{3}, \quad \hat{\theta}_4 = 3Y_{(1)}, \quad \hat{\theta}_5 = \bar{Y}.$$

Which ones of these estimators are unbiased? Among the unbiased ones which one has the smallest variance?

**Solution:** First, let us check for unbiasedness.

$$\begin{split} \mathbb{E}[\hat{\theta}_1] &= \mathbb{E}[Y_1] = \tau \\ \mathbb{E}[\hat{\theta}_2] &= \mathbb{E}\left[\frac{Y_1 + Y_2}{2}\right] = \tau \\ \mathbb{E}[\hat{\theta}_3] &= \mathbb{E}\left[\frac{Y_1 + 2Y_2}{3}\right] = \tau \\ \mathbb{E}[\hat{\theta}_4] &= \mathbb{E}\left[3Y_{(1)}\right] = 3 \cdot \frac{\tau}{3} = \tau \\ \mathbb{E}[\hat{\theta}_5] &= \mathbb{E}\left[\frac{Y_1 + Y_2 + Y_3}{3}\right] = \tau \end{split}$$

So, all of the offered estimators are unbiased.

Now, for the variance, we have

$$\begin{aligned} & \text{Var}[\hat{\theta}_{1}] = \text{Var}[Y_{1}] = \tau^{2} \\ & \text{Var}[\hat{\theta}_{2}] = \text{Var}\left[\frac{Y_{1} + Y_{2}}{2}\right] = \frac{2\tau^{2}}{4} = \frac{\tau^{2}}{2} \\ & \text{Var}[\hat{\theta}_{3}] = \text{Var}\left[\frac{Y_{1} + 2Y_{2}}{3}\right] = \frac{1}{9}(\tau^{2} + 4\tau^{2}) = \frac{5\tau^{2}}{9} \\ & \text{Var}[\hat{\theta}_{4}] = \text{Var}\left[3Y_{(1)}\right] = 9 \cdot \left(\frac{\tau}{3}\right)^{2} = \tau^{2} \\ & \text{Var}[\hat{\theta}_{5}] = \text{Var}\left[\frac{Y_{1} + Y_{2} + Y_{3}}{3}\right] = \frac{\tau^{2}}{3} \end{aligned}$$

The sample mean has the minimum variance.

**Problem 15.2.** Suppose that the two estimators  $\hat{\theta}_1$  and  $\hat{\theta}_2$  are unbiased. We know that  $Var[\hat{\theta}_1] = \sigma_1^2$  and  $Var[\hat{\theta}_2] = \sigma_2^2$ .

Consider the estimator all the estimators that can be obtained as convex combinations of  $\hat{\theta}_1$  and  $\hat{\theta}_2$ , i.e., all the estimators of the form

$$\hat{\theta} = \alpha \hat{\theta}_1 + (1 - \alpha)\hat{\theta}_2.$$

What can you say about the bias of estimators  $\hat{\theta}$  of the form above? Assuming that  $\hat{\theta}_1$  and  $\hat{\theta}_2$  are **independent**, for which weight  $\alpha$  is the variance minimal?

**Solution:** Due to the linearity of expectation, we have

$$\mathbb{E}[\hat{\theta}] = \alpha \mathbb{E}[\hat{\theta}_1] + (1 - \alpha) \mathbb{E}[\hat{\theta}_2] = \theta.$$

So, each estimator of the above form is *unbiased*. Now, let's consider the variance. We want to solve this optimization problem

$$\begin{split} \mathrm{Var}[\hat{\theta}] &\to \min \\ \Leftrightarrow \\ \mathrm{Var}[\alpha \hat{\theta}_1 + (1-\alpha) \hat{\theta}_2] &\to \min \end{split}$$

Due to **independence** of  $\hat{\theta}_1$  and  $\hat{\theta}_2$ , the above is equivalent to

$$\alpha^2 \operatorname{Var}[\hat{\theta}_1] + (1-\alpha)^2 \operatorname{Var}[\hat{\theta}_2] \to \min \Leftrightarrow$$
  
 $\alpha^2 \sigma_1^2 + (1-\alpha)^2 \sigma_2^2 \to \min$ 

This is an upward facing parabola in  $\alpha$ . So, if we differentiate with respect to  $\alpha$ , set our derivative equal to zero, and solve for  $\alpha$  we will figure out the minimum.

$$2\alpha\sigma_1^2 - 2(1-\alpha)\sigma_2^2 = 0 \quad \Leftrightarrow \quad \alpha(\sigma_1^2 + \sigma_2^2) = \sigma_2^2 \quad \Leftrightarrow \quad \alpha = \frac{\sigma_2^2}{\sigma_1^2 + \sigma_2^2} \,.$$

**Problem 15.3.** Let  $Y_1, Y_2, \ldots, Y_n$  be a random sample from a continuous distribution with probability density function

$$f_Y(y) = \frac{\alpha y^{\alpha - 1}}{\theta^{\alpha}} \mathbf{1}_{[0, \theta]}(y)$$

with a known parameter  $\alpha > 0$  and an unknown parameter  $\theta > 0$ . We propose the estimator  $\hat{\theta} = \max(Y_1, \dots, Y_n)$ . Is this estimator unbiased? If not, how would you modify it to create an unbiased estimator? What is the **mean-squared error** of the unbiased estimator you obtained?

**Solution:** The proposed estimator is the  $n^{th}$  order statistic. So, let's start by figuring out its density; it will be, for  $y \in [0, \theta]$ ,

$$g_{(n)}(y) = n f_Y(y) (F_Y(y))^{n-1}$$

where  $F_Y$  stands for the cumulative distribution function of Y. In fact, for  $y \in [0, \theta]$ , we have that

$$F_Y(y) = \int_0^y f_Y(u) \, du = \frac{\alpha}{\theta^{\alpha}} \int_0^y u^{\alpha - 1} \, du = \frac{\alpha}{\theta^{\alpha}} \cdot \frac{y^{\alpha}}{\alpha} = \left(\frac{y}{\theta}\right)^{\alpha}$$

This is the reason that distributions from this family are called **power distributions**. Now, we have that, for  $y \in [0, \theta]$ ,

$$g_{(n)}(y) = n \frac{\alpha y^{\alpha - 1}}{\theta^{\alpha}} \left( \frac{y}{\theta} \right)^{\alpha(n - 1)} = \frac{n\alpha}{\theta^{\alpha n}} y^{\alpha n - 1}$$

Hence,

$$\mathbb{E}[\hat{\theta}] = \int_0^\theta y g_{(n)}(y) \, dy = \int_0^\theta y \frac{n\alpha}{\theta^{\alpha n}} y^{\alpha n - 1} \, dy = \frac{n\alpha}{\theta^{\alpha n}} \int_0^\theta y^{\alpha n} \, dy = \frac{n\alpha}{\theta^{\alpha n}} \cdot \frac{\theta^{\alpha n + 1}}{\alpha n + 1} = \frac{\alpha n}{\alpha n + 1} \theta \neq \theta.$$

So, our estimator is biased, but if we instead consider

$$\hat{\theta}' = \frac{\alpha n + 1}{\alpha n} \hat{\theta},$$

this estimator will be unbiased. By the proposition from class, we know that

$$MSE[\hat{\theta}'] = Var(\hat{\theta}') = \left(\frac{\alpha n + 1}{\alpha n}\right)^2 Var[\hat{\theta}].$$

Focusing on the second moment of  $\hat{\theta}$ , we obtain

$$\mathbb{E}[\hat{\theta}^2] = \int_0^\theta y^2 g_{(n)}(y) \, dy = \int_0^\theta y^2 \frac{n\alpha}{\theta^{\alpha n}} y^{\alpha n - 1} \, dy = \frac{n\alpha}{\theta^{\alpha n}} \int_0^\theta y^{\alpha n + 1} \, dy = \frac{n\alpha}{\theta^{\alpha n}} \frac{\theta^{\alpha n + 2}}{\alpha n + 2} = \frac{\alpha n}{\alpha n + 2} \theta^2.$$

Finally,

$$\operatorname{Var}[\hat{\theta}] = \frac{\alpha n}{\alpha n + 2} \theta^2 - \left(\frac{\alpha n}{\alpha n + 1}\right)^2 \theta^2$$

and

$$\operatorname{Var}[\hat{\theta}'] = \left(\frac{\alpha n + 1}{\alpha n}\right)^2 \left(\frac{\alpha n}{\alpha n + 2}\theta^2 - \left(\frac{\alpha n}{\alpha n + 1}\right)^2 \theta^2\right) = \left(\frac{(\alpha n + 1)^2}{\alpha n (\alpha n + 2)} - 1\right)\theta^2 = \frac{1}{\alpha n (\alpha n + 2)}\theta^2.$$
