UNIVERSITY OF TEXAS AT AUSTIN

Problem Set #10

Binomial option pricing: Two or more periods.

Problem 10.1. For a two-period binomial model, you are given that:
  (1) each period is one year;
  (2) the current price of a <u>non-dividend-paying</u> stock S is $S(0) = \$20$;
  (3) $u = 1.2$, with u as in the standard notation for the binomial model;
  (4) $d = 0.8$, with d as in the standard notation for the binomial model;
  (5) the continuously compounded risk-free interest rate is $r = 0.04$.

Consider a **special** call option which pays the excess above the strike price $K = 23$ (if any!) at the end of **every** binomial period.

Find the price of this option.

Problem 10.2. Let the continuously compounded risk-free interest rate be 0.10. Let the initial price of a non-dividend-paying stock be $100 per share. You use a five-period binomial tree to model the stock price over the next year. Let $u = 1.04$ and $d = 0.96$.

What is the price of a one-year, at-the-money European call option on the above stock?
